

Preemptive Email Vault

Email Management

Would you like to:

- Reduce your storage costs?
- Improve your Domino mail performance?
- Future-proof your email holdings?
- Eliminate personal email archives but still allow access to old emails?
- Significantly reduce time and costs when conducting email search and discovery?
- Shrink existing email databases?
- Store and retrieve attachments instantly?
- Identify your top email consumers in seconds?
- Collect comprehensive email statistics?

Well now you can, and much more!

The Preemptive Email Vault is the answer to achieving all of the above and also greatly improves your email operating efficiencies.

It is becoming more and more apparent that EMAIL has become the life force of many organisations – yet this life force can impact the effectiveness of users through sheer overload. The volume and size of emails and attachments can choke and slow down servers to a crawl.

We also know that Email Management reduces liabilities and costs whilst aiming to increase productivity. Failure to establish, enforce and monitor email policies can expose organisations and individuals to unacceptable risks and costs.

To prevent these risks, organisations need good email management tools. The Preemptive Email Vault is a tool that is simple and inexpensive to add to your existing email system, and yet provides a powerful safety net for your email environment.

What is the Preemptive Email Vault?

The Preemptive Email Vault is a centralised system that stores all inbound, outbound and circulating emails within your organisation. All this is performed in real-time. Messages are efficiently filed into the Preemptive Email Vault and can be retrieved on demand.

Why use the Preemptive Email Vault?

Some organisations try to keep everything, some keep nothing and others want end users to manage their own data holdings. All of these strategies have problems that can represent very real threats to your organisation's efficiency, profit and reputation.

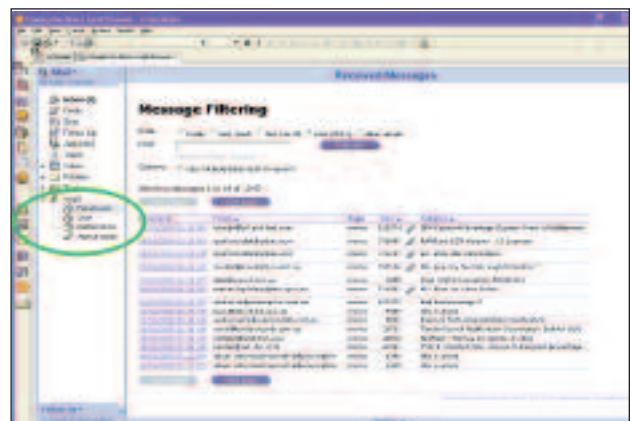

The Preemptive Email Vault simplifies this email retention dilemma by centrally capturing all email. This prevents the embarrassment of lost emails and critical information.

The Preemptive Email Vault can significantly reduce the time and costs spent to undertake an email search and discovery exercise. (A court-ordered search of all email can cost in excess of \$200,000 per incident.)

The Vault Personal Browser

The Vault Personal Browser allows email users to see their own email within the Vault, thus eliminating the need for personal archives. Users can search through their sent and received emails, recall attachments or find an email via a file reference. Once found, it is possible to seamlessly restore the email into their regular mail database. The restored email is just like the original.

The Vault Personal Browser simply sits within the Notes Mail client – there is no installation required at the user's PC!

Defer your next hardware upgrade and save

Email volumes continue to grow annually. This load can slow even the most carefully designed Domino infrastructure. The Preemptive Email Vault can prolong the life of your Domino server hardware by storing each email in a compressed format in a relational database. This provides excellent scalability and performance even with the most demanding loads.

Installation is a snap

It only takes a couple of hours on average to install and set up the Preemptive Email Vault. Modifications to the Notes email template take approximately ten minutes.

Focus training for maximum return

The Preemptive Email Vault can provide a report on the top email consumers and producers within your organisation. This makes it easier for you to target your training requirements and better utilise your training budget. Your peak users will become more productive with very little training – delivering a great return on your investment!

Store and retrieve attachments instantly

Attachments can occupy up to 90 per cent of email storage. The Preemptive Email Vault stores just one compressed copy of each unique attachment and then a small pointer to the file is added (regardless of the number of times it's attached).

As each email attachment has its own digital signature, tracking them is pure simplicity. Find out who sent it, when they sent it, where it went, and whether it was on-forwarded. Extracting attachments from the Preemptive Email Vault to view images can be done with the press of a button.

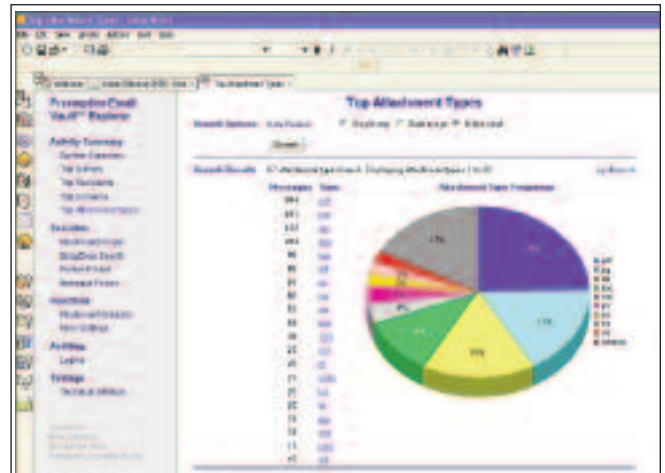

Additionally, the Attachment Stubber feature looks in each user's email database for attachments and replaces them with a very small link. With the click of a button they can retrieve the file when needed. This simple technique can bring about massive storage savings.

Future-proof your emails

Preemptive Email Vault future-proofs your email holdings by using standard XML to store emails. It also allows for future message re-creation with the reliability of IBM's DXL. As a result, restore times are within seconds – not hours or days.

Have complete visibility of your entire email system

Management access to the Preemptive Email Vault is via the Preemptive Email Vault Explorer. This tool gives email administrators and auditors complete visibility over your email system.

With the Preemptive Email Vault Explorer, you can:

- Find and track attachments in seconds
- Recover messages instantly
- Identify top email authors and recipients within your organisation so you can target your training effectively and efficiently
- Identify the most frequently sent/received attachment types and top domains, allowing you to fine tune your email policies
- Monitor and track the effectiveness of your email policies
- Graph selected information at the press of a button.

Note: All use of the Preemptive Email Vault Explorer is logged and viewed via audit trails.

Software prerequisites

- Lotus Notes/Domino 6.5.1 or higher, 7.0 or higher preferred, on a Lotus supported Windows operating system.
- IBM DB2 8.2 or other supported database.
